

What is claimed:

1. A spatula device for performance of a laryngoscopic treatment of patients which are intubatable conventionally or with difficulties characterized in that the spatula device comprises a flat element at its distal end wherein the flat element is hinged.
2. The spatula device according to claim 1, wherein the distal end is hinged by means of a pulling handle.
3. The spatula device according to claim 1, including an optical device for observation of space around distal end of the spatula device.
4. The spatula device according to claim 3, wherein the optical device includes a light emission output, which is inclined to a longitudinal axis of the optical device.
5. The spatula device according to claim 3, wherein the optical device is firmly fixable.
6. The spatula device according to claim 3, wherein the optical device is removable.
7. The spatula device according to claim 3, wherein the optical device is provided in a stiff manner.
8. The spatula device according to claim 3, wherein the optical device is provided in a flexible manner.
9. The spatula device according to claim 3, wherein the optical device includes a wide-angle lens with an angle ranging from 0 to 75 degrees.
10. The spatula device according to claim 3, wherein the optical device comprises a cold light source connection.
11. The spatula device according to claim 1, wherein the flat element comprises a thickened rounded lip.
12. The spatula device according to claim 2, including an optical device for observation of space around distal end of the spatula device.
